BAHANTABAY

High-Level Mockup

Community-Based Flood Monitoring and Route Warning App

The following mockups present the five MVP screens established in the Bahantabay proposal and preliminary wireframes, now rendered in full colour using the finalized M7A3 design system. The layouts remain based on the existing wireframes; this mockup stage applies the actual typography, spacing, colours, components, icons, and realistic example content that will guide the Flutter implementation.

All mockups use approximately 390×844 phone proportions. Home is shown in both List View and Map View, but these are two visual states of the same Home screen rather than separate MVP screens. This preserves the five-screen structure defined in M7A1.

Main user journey

Sign In / Guest Entry → Home

From Home, the user can open Add Route, Route Details, or Report Flood. Route Details can also lead directly to Report Flood.

1. Sign In / Guest Entry

HOLY ANGEL UNIVERSITY
School of Computing
6ADET

The image shows a mobile application interface for 'Bahantabay'. At the top, there is a logo consisting of a white house icon with a location pin and an upward arrow, with the text 'Bahantabay' and the tagline 'Iwas Baha, Iwas Abala.' below it. The main content area is a dark blue rounded rectangle containing a white login form. The form has two input fields: 'Email' with the placeholder 'Enter your email' and 'Password' with the placeholder 'Enter your password' and an eye icon for toggling visibility. Below the password field are two buttons: 'Sign In' and 'Continue as Guest'. At the bottom of the form, there is a link: 'Don't have an account? Sign Up'. At the very bottom of the app screen, there is a small text line: 'Community flood reports for safer routes.'

Figure 1. Sign In / Guest Entry

HOLY ANGEL UNIVERSITY
School of Computing
6ADET

What the user does here:

The user enters an email and password to sign in, continues as a guest for read-only access, or switches the same authentication screen into sign-up mode if they do not yet have an account.

Where the tappable elements go:

Sign In → Home

Continue as Guest → Home (read-only session)

Sign Up → Sign-up mode on the same Sign In / Guest Entry screen

The Sign In / Guest Entry mockup uses Bahantabay's Flood Blue as a full-screen branded hero treatment before the user enters the functional Mist Grey screens. This auth-specific use of Flood Blue is documented in the finalized M7A3 design system.

2. Home

HOLY ANGEL UNIVERSITY
School of Computing
6ADET

Figure 2A. Home — List View

Figure 2B. Home — Map View

Figures 2A and 2B represent two states of the same Home screen, controlled by the List ↔ Map toggle.

Home supports two presentation states, switched by a centered segmented List ↔ Map control positioned directly below the app bar. The app bar itself contains Bahantabay branding on the left and the profile/account icon on the right. Both List and Map states belong to the same Home screen and share the same navigation and account controls.

HOLY ANGEL UNIVERSITY
School of Computing
6ADET

List View

- Mist Grey application background.
- Saved routes displayed as RouteCards with status badge, leading status-color dot, and distance/time.
- Nearby reports displayed as FloodReportEntry rows.
- Optimized for quickly scanning several routes and reports.

Map View

- Full Flood Blue map canvas for an immersive geographic presentation.
- Simplified two-point route representation shown as a straight/dashed line between saved start and destination points.
- Flood-report markers displayed relative to the route.
- Floating white warning summary card for the selected route, with a **View** action leading to Route Details.
- Report Flood floating action remains available.
- Optimized for understanding geographic context rather than scanning multiple list items.

What the user does here:

The user checks saved routes and current flood conditions, scans nearby flood reports, switches between List and Map presentation, opens a saved route, creates a new route, starts a flood report, or uses the profile icon to access account actions.

Where the tappable elements go:

Profile icon → Account menu overlay

Log out → Sign In / Guest Entry

Switch account → Sign In / Guest Entry

Sign in / Create account (guest mode) → Sign In / Guest Entry

HOLY ANGEL UNIVERSITY
School of Computing
6ADET

List ↔ Map → Changes Home presentation only

RouteCard → Route Details

+ Add route → Add Route

Report Flood → Report Flood

The app bar is reserved for global application controls: Bahantabay branding on the left and account access on the right. The centered List ↔ Map control sits directly below the app bar because it changes how the Home content itself is presented rather than performing a global application action.

List View uses the default Mist Grey application background and prioritizes fast scanning of saved routes and nearby reports.

Map View uses a full Flood Blue map treatment to create a more immersive geographic presentation. It still follows the simplified MVP route model: a saved route is represented using its selected start and destination points rather than a road-following Directions API path.

3. Add Route

HOLY ANGEL UNIVERSITY
School of Computing
6ADET

The screenshot shows a mobile application interface for adding a route. At the top, there is a dark blue header with a back arrow and the text "Add route". Below this, the "Route name" section features a text input field with the placeholder text "e.g. Home to School". The "Select route points" section contains a map area with a dashed blue line connecting a "Start" point to a "Destination" point. Below the map, a text instruction reads "Tap the map to select your starting point and destination." A list below this shows "Start" and "Destination" both marked as "Selected" with green checkmarks. At the bottom, there is a large dark blue button labeled "Save route".

Figure 3. Add Route

HOLY ANGEL UNIVERSITY
School of Computing
6ADET

What the user does here:

The user gives the route a name, taps a starting point and destination on the map, confirms both points, and saves the route.

Where the tappable elements go:

Back arrow → Home without saving

Map → Selects start and destination coordinates

Save route → Home with the route saved

The mockup follows Bahantabay's simplified MVP route model: the route is represented by the selected start and destination coordinates rather than a road-following Directions API path, matching the revised proposal. M7A1 defines Add Route as a two-point map-selection workflow.

4. Route Details

HOLY ANGEL UNIVERSITY
School of Computing
6ADET

Figure 4. Route Details

HOLY ANGEL UNIVERSITY
School of Computing
6ADET

What the user does here:

The user checks the selected route's current status, views the simplified route and nearby flood-report marker on the map, reads the report affecting the route, and can submit another flood report if needed.

Where the tappable elements go:

Back arrow → Home

Report Flood → Report Flood

Route Details is the screen where Bahantabay's core route-warning concept becomes most visible: the saved route, map information, nearby community report, and resulting WARNING status are presented together. The amber RouteWarningBanner explains why the route is currently flagged before the user reaches the detailed flood-report entry.

5. Report Flood

HOLY ANGEL UNIVERSITY
School of Computing
6ADET

The image shows a mobile application interface for reporting a flood. The screen has a dark blue header with a back arrow and the text "Report Flood". Below the header, the form is organized into sections: "Report location" with a map placeholder and a "Selected location" label; "Flood depth" with a dropdown menu labeled "Select flood depth"; "Road status" with two buttons, "Passable" (white) and "Not passable" (red); "Notes (optional)" with a text input field labeled "Add details about the flood..."; and a large blue "Submit Report" button at the bottom.

Figure 5. Report Flood

HOLY ANGEL UNIVERSITY
School of Computing
6ADET

What the user does here:

The user selects or confirms the flood location, chooses the flood depth, marks the road as passable or not passable, optionally enters notes, and submits the community report.

Where the tappable elements go:

Back arrow → Previous screen (Home or Route Details)

Map → Selects report location

Flood depth → Opens depth options

Passable / Not passable → Selects road status

Submit Report → Home with the report saved

The Report Flood screen remains fully usable without GPS because location can always be selected manually on the map, matching the fallback planned in the proposal. M7A1 specifies location selection, flood depth, road status, optional notes, and a manual map-based fallback when device location is unavailable.

Bahantabay - User Journey

The five MVP screens below are arranged to show Bahantabay's main user journey. Home List View and Home Map View are two states of the same Home screen, not separate screens.

HOLY ANGEL UNIVERSITY
School of Computing
6ADET

Account flow: Home → Profile icon → Account menu → Sign In / Guest Entry (after Log out, Switch account, or guest Sign in/Create account).

The Home List ↔ Map toggle changes only how Home presents its information and does not create a separate screen. The account menu is also an overlay rather than a separate screen. Bahantabay therefore remains a five-screen MVP.

From	Tappable element	Leads to / Result
Sign In / Guest Entry	Sign In	Home
Sign In / Guest Entry	Continue as Guest	Home — read-only session
Sign In / Guest Entry	Sign Up	Sign-up mode on the same authentication screen
Home	Profile icon	Opens account menu overlay
Account menu	Log out	Sign In / Guest Entry
Account menu	Switch account	Sign In / Guest Entry
Account menu	Sign in / Create account (guest mode)	Sign In / Guest Entry

HOLY ANGEL UNIVERSITY
School of Computing
6ADET

Home	List ↔ Map toggle	Switches Home presentation only; remains on Home
Home	RouteCard	Route Details
Home	+ Add route	Add Route
Home	Report Flood	Report Flood
Add Route	Back arrow	Home — changes discarded
Add Route	Save route	Home — route saved
Route Details	Back arrow	Home
Route Details	Report Flood	Report Flood
Report Flood	Back arrow	Previous screen — Home or Route Details
Report Flood	Map	Selects report location
Report Flood	Flood depth	Opens flood-depth options
Report Flood	Passable / Not passable	Selects road status
Report Flood	Submit Report	Home — report submitted

What Changed, and Why

The wireframes themselves remain unchanged. Painting them into full-colour mockups revealed a small number of visual-system details that needed to be formally documented in M7A3 so that the mockups and later Flutter implementation use the same rules.

Screen or element	The wireframe / earlier design system assumed	The mockup shows	What changed, and why

HOLY ANGEL UNIVERSITY
School of Computing
6ADET

Home navigation and view controls	The original Home treatment placed the List/Map control in the app bar and did not define a clear way to log out, switch accounts, or leave guest mode.	The final Home app bar contains Bahantabay branding and a profile icon, while the List/Map segmented control is centered below the app bar. The profile icon opens account actions without leaving Home.	Keep this hierarchy in the Flutter implementation. Account actions will use a Material overlay rather than a new screen, preserving the five-screen MVP while providing a complete authentication exit path.
Home Map presentation	The map was treated as another light embedded map surface similar to the map areas on the form/detail screens.	Home Map View uses an immersive Flood Blue map canvas while keeping the same two-point route model and warning information.	Update M7A3 to distinguish the full-screen Home Map treatment from the lighter Alice Blue embedded map panels. No new color is needed because Home Map reuses Flood Blue.
Route Details warning message	The earlier component system did not formally define a route-level warning banner.	A distinct amber warning message appears between the map and nearby flood reports.	Keep RouteWarningBanner documented in M7A3 so it becomes a buildable component rather than undocumented one-off UI.

HOLY ANGEL UNIVERSITY**School of Computing****6ADET**

Additional RouteCard refinement: the mockup retains both the text-labelled StatusBadge and the small leading status-colour dot. M7A3 now documents the dot as a secondary visual cue derived from the same RouteStatus; the badge remains the primary readable status indicator.
